Dear Hiring Manager,

I am excited at the prospect of joining Isometric to further the organization's policy efforts across the Americas. I care deeply about the environment and desire to use public policy as a vehicle to preserve the integrity of the world's ecosystems and create more resilient communities in the face of unprecedented adversity. Given Isometric's dedication to assembling a dynamic, upstanding team to create a more trustworthy and impactful carbon removal market, I am glad for the opportunity to offer my strengths to your organization.

Having recently earned my master's degree from Carnegie Mellon University, I strive to find creative ways to combine public policy, big data, and biogeography to create a better future. Over the course of my master's degree, I have put my policy skills to work by researching the implications of drought in the US West and the feasibility of converting farmland into wetlands in the Klamath River Basin to bolster the region's ecological security and ensure the historic fishing rights of the native Klamath Tribes. I used my more technical skills to create a Shorthand website that conveys the ecological importance of keystone predators in California's kelp forests. The site tells the story of how the global sea star wasting syndrome pandemic of 2013 is responsible for the disappearance of kelp across the West Coast. I used satellite imagery of kelp biomass across the entire California coastline to create an animation in ArcGIS Pro that shows its rapid decline after the onset of the wasting syndrome pandemic.

I have also had the privilege to work with local organizations on projects to help them better serve their constituents. I worked with a team of students assisting nonprofits in the Pittsburgh area to better understand shortcomings in their services for English-language-learners. Additionally, I worked with another group to create the [first open-source map](#) of peer-to-peer lending behaviors in the United States, estimated via machine learning, for the company Giving Credit. Both projects required extensive interviewing with a wide variety of stakeholders as well as many dynamic pivots to adapt to changing information and the changing expectations of the clients. I believe that these projects, as well as other experiences at Carnegie Mellon in the paradigm of design thinking, have made me better accustomed to the work style espoused in Isometric's operating principles.

As the organization continues to pursue its policy priorities, I would greatly appreciate your consideration of the contributions I can make to Isometric's policy team. I am happy to respond to any questions you may have in an interview or over email. I look forward to hearing from you.

Sincerely,

Henri Neblina
